

Personal Portfolio Update

Abdi Gebisa Nagasa

The Idea Behind This Update

This update keeps my original portfolio and the work already presented there. I am adding two new websites to show another part of my learning journey: building practical software projects and putting them online.

What I Am Keeping

My original research, physics interests, academic background, STEM Center experience, certificates, projects, documents, and personal information remain part of the portfolio. The purpose is not to replace my original work, but to continue building on it.

New Website Projects

1. Interactive Web Library System

I built this as a practical web project to learn how a library resource and catalog system can work through an interactive website. The project includes searching, category filtering, checkout logic, and browser-based data persistence. It is also deployed publicly through GitHub Pages.

Live project: <https://abdi-gebisa.github.io/Library-management-system/>

2. Second New Website

The second website is also added to my portfolio as part of my continuing software-development work. It is presented alongside my existing projects rather than replacing them.

A Personal Portfolio, Not a Generic Profile

The portfolio is intended to represent my actual path: a Grade 12 student from Ethiopia who is interested in physics and software engineering, who has worked on research ideas, learned programming, built projects, and is continuing to develop through independent work.

What Is Not Included

The C++ Library System is not included in this update. The original portfolio is maintained, and the focus here is on adding the two new websites without making the portfolio feel unnecessarily different.

Update Principle

Keep the original. Add the new work. Let the projects and experiences speak for themselves.
